Note All vector spaces are real and finite dimensional unless otherwise stated.

Definition 0.1 A bilinear form $\Omega : V \times V \rightarrow \mathbb{R}$ on a vector space V is a *linear symplectic form* if it is

- (a) skew-symmetric, i.e. $\Omega(v, w) = -\Omega(w, v) \quad \forall v, w \in V$;
- (b) non-degenerate, i.e. $\Omega(v, w) = 0 \quad \forall v \in V \implies w = 0$.

Example 0.2

- (1) Consider¹ $V = \mathbb{R}^2, B = (e_1, e_2)$. Then² $[\Omega]_B^B = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}$ represents a linear symplectic form on \mathbb{R}^2 .
- (2) Consider $V = \mathbb{R}^{2n}, B = (e_1, \dots, e_n, f_1, \dots, f_n)$. Then

$$[\Omega]_B^B = \left(\begin{array}{c|c} 0 & I_n \\ \hline -I_n & 0 \end{array} \right)$$

represents a linear symplectic form on \mathbb{R}^{2n} . Moreover, we have that

$$\begin{aligned} \Omega(e_1, e_j) &= 0, \\ \Omega(f_i, f_j) &= 0, \\ \Omega(e_i, f_j) &= \delta_{ij} = -\Omega(f_j, e_i). \end{aligned} \tag{0.1}$$

Definition 0.3 The pair (V, Ω) is a (*real*) *symplectic vector space*. If it has a basis $B = (e_1, \dots, e_n, f_1, \dots, f_n)$ satisfying the relations given by the equations in (0.1), we say that B is a *symplectic basis* of (V, Ω) .

Remark 0.4 If B is an ordered basis of V , then $[\Omega]_B^B$ is antisymmetric and invertible.

Example 0.5 Let W be a vector space with dual W^* and $V = W \oplus W^*$. Note there is an isomorphism of vector spaces $W \oplus W^* \xrightarrow{\sim} W^* \oplus W, (w, f) \mapsto (f, -w)$. Then,

$$\begin{aligned} \Omega : V \times V &\rightarrow \mathbb{R}, \\ ((w_1, f_1), (w_2, f_2)) &\mapsto f_2(w_1) - f_1(w_2) \end{aligned}$$

is a linear symplectic form on V .

¹Whenever order is needed for a basis, I write them as ordered bases (i.e. between parenthesis) instead of unordered sets, and this is important to me!

²The notation $[\Gamma]_\alpha^\beta$ indicates the matrix representation of the bilinear form Γ which takes column vectors $[w]_\alpha$ from the right represented, which are with an ordered basis α , and row vectors $([v]_\beta)^T$ from the left, which are represented with an ordered basis β and transposed, and computes $\Gamma(v, w)$.

Lemma 0.6 If (V, Ω) is a symplectic vector space, then $2 \mid \dim(V)$.

Proof. If A represents Ω , then

$$\begin{aligned}\det(A) &= \det(-A^T) \\ &= \det(-A) \\ &= (-1)^{\dim(V)} \det(A).\end{aligned}$$

□

Definition 0.7 Let (V, Ω) be a symplectic vector space. A linear subspace $U \subseteq V$ is

- (a) *symplectic* if $\Omega|_U$ is a linear symplectic form on U (non-degeneracy is sufficient);
- (b) *isotropic* if $\Omega|_U = 0$;
- (c) *coisotropic* if $\Omega(u, v) = 0 \quad \forall u \in U \implies v \in U$;
- (d) *Lagrangian* if it is both isotropic and coisotropic.

Example 0.8 Let $V = \mathbb{R}^{2n}$, $B = (e_1, \dots, e_n, f_1, \dots, f_n)$.

- (1) $\langle \{e_1, f_1\} \rangle$ is a symplectic subspace which is neither isotropic nor coisotropic (thus neither Lagrangian).
- (2) $\langle \{e_1, \dots, e_n\} \rangle$ is a Lagrangian subspace which is not symplectic.
- (3) $\{0\}$ and $\langle \{e_1, \dots, \hat{e}_k, \dots, e_n\} \rangle$, where \hat{e}_k indicates the exclusion of the k -th vector of the canonical ordered basis from the set, are isotropic subspaces which are not coisotropic, where the first one is trivially symplectic.
- (4) If $I, J \subseteq \{1, \dots, n\}$ and $\langle \{e_i\}_{i \in I} \cup \{f_j\}_{j \in J} \rangle$ is
 - symplectic if, and only if, $I = J$;
 - isotropic if, and only if, $I \cap J = \emptyset$;
 - coisotropic if, and only if,

Add characterization.

 - Lagrangian if, and only if, $I = J^c$.

12/3/24

Remark 0.9 Let V be a real finite dimensional vector space with dual V^* and $\Omega : V \times V \rightarrow \mathbb{R}$ a bilinear form. Then, we have the linear isomorphism³

$$\begin{aligned}\Omega^\# &= \tilde{\Omega} : V \rightarrow V^*, \\ v &\mapsto \Omega(v, \cdot).\end{aligned}$$

Ω is symplectic if and only if

- (1) $\Omega^\#$ is antiselfdual, i.e. $(\Omega^\#)^* = -\Omega^\#$, and

³I believe we need to ask for $v \neq 0$, although the professor didn't mention it.

(2) $\Omega^\#$ is injective (or, equivalently, an isomorphism).

Definition 0.10 Let (V, Ω) be a symplectic vector space and $U \subseteq V$ a linear subspace. The *symplectic orthogonal* or *symplectic annihilator* of U is

$$U^\Omega := \{v \in V \mid \Omega(u, v) = 0 \quad \forall u \in U\}.$$

Proposition 0.11 Let (V, Ω) be a symplectic vector space and $U \subseteq V$ a linear subspace. Then,

$$\dim(U) + \dim(U^\Omega) = \dim(V) \quad \text{and} \quad (U^\Omega)^\Omega = U.$$

Proof. The first part follows from the fact that $\Omega^\#$ is an isomorphism. Moreover, the inclusion $U \subseteq (U^\Omega)^\Omega$ follows from Definition 0.10 and the equality follows by noticing their dimensions are equal. \square

Remark 0.12 Let U be a linear subspace of a symplectic vector space (V, Ω) . Then U is

- symplectic if, and only if $V = U \oplus U^\Omega$;
- isotropic if, and only if, $U \subseteq U^\Omega$;
- coisotropic if, and only if, $U \supseteq U^\Omega$;
- Lagrangian if, and only if, $U = U^\Omega$.

Exercise 0.13 Prove that

- (1) U is symplectic if, and only if, U^Ω is symplectic;
- (2) U is isotropic if, and only if, U^Ω is coisotropic;
- (3) $(U \cap W)^\Omega = U^\Omega + W^\Omega$.

Proposition 0.14 A symplectic vector space (V, Ω) with $\dim(V) = 2n$ has a symplectic basis.

Proof. We will prove this by induction, taking as basis $\dim(V) = 2$. Let $e_1 \neq 0$. Then there exists $v \in V$ such that $\Omega(e_1, v) \neq 0$. By the Gram-Schmidt orthonormalization process, it follows that $\{e_1, \frac{v}{\Omega(e_1, v)}\}$ is a symplectic basis.

Assume the Proposition holds for $\dim(V) = 2n$. Let $v, v' \in V$ be such that $\Omega(v, v') \neq 0$. Then $(S := \langle v, v' \rangle, \Omega|_S)$ is a symplectic space of dimension 2. Note that $(S^\Omega, \Omega|_{S^\Omega})$ is a symplectic vector space of dimension $2n$. Since $V = S \oplus S^\Omega$, where both subspaces have symplectic bases due to the induction hypothesis, it follows that (V, Ω) has a symplectic basis. \square

Remark 0.15 If L is a Lagrangian subspace of a symplectic vector space (V, Ω) , then $\dim(L) = \frac{\dim(V)}{2}$.

Proposition 0.16 (Lagrangian split) Let (V, Ω) be a symplectic vector space. Then, there exist Lagrangian subspaces L, L' such that $V = L' \oplus L$.

Proof.

Exercise 0.17 Write the proof; the idea is to show that you can find a maximal (with respect to dimension) isotropic subspace. \square

Remark 0.18 Recall that linear maps $\varphi : V \rightarrow V$ induce a map between bilinear forms via

$$\varphi^*(\Omega(v, v')) = \Omega(\varphi(v), \varphi(v')).$$

The Lagrangian split $V = L \oplus L'$ of Proposition 0.16 is canonical in the sense that there exists a canonical isomorphism $\varphi : V \rightarrow L \oplus L'$ such that $(\varphi^{-1})^*\Omega$ is the canonical symplectic form on $L \oplus L'$, i.e.

$$\Omega(v_1 + v'_1, v_2 + v'_2) = \Omega(v_1, v'_2) - \Omega(v_2, v'_1).$$

Definition 0.19 M is a *topological manifold* if it is a topological space such that

- $\forall p \in M$, there exists a neighborhood V of p that is homeomorphic to an open set in \mathbb{R}^n ;
- it is Hausdorff, i.e. for any two points we can find a neighbourhood for each such that they are disjoint;
- it satisfies the second countability axiom, i.e. there exists a countable basis.

Example 0.20

- (1) The torus $T^2 = S^1 \times S^1$, obtained via the identification

Add identification!

.

- (2) The Klien bottle K^2 , obtained via the identification $(x, y) \sim (x + 1, y) \sim (1 - x, y + 1)$ in $[0, 1] \times [0, 1] \subseteq \mathbb{R}^2$.
- (3) The projective plane, obtained via the identification $(x, y) \sim (x + 1, 1 - y) \sim (1 - x, y + 1)$ in $[0, 1] \times [0, 1] \subseteq \mathbb{R}^2$.

Remark 0.21 Recall that M is a differential manifold if it is a topological manifold of dimension n with an atlas, which is a collection of charts $\{U_\alpha, \varphi_\alpha\}_{\alpha \in A}$ such that

- (1) $U_{\alpha \in A} \varphi_\alpha(U_\alpha) = M$,
- (2) $W = \varphi_\beta(U_\beta) \cap \varphi_\alpha(U_\alpha) \neq \emptyset$, where $\varphi_\beta^{-1} \varphi_\alpha$ and $\varphi_\alpha \varphi_\beta^{-1}$ are of class C^∞ ,
- (3) $U_{\alpha \in A} \varphi_\alpha(U_\alpha)$ is maximal.
